Day: December 16, 2017 Following revelations that three women who worked on the Weinstein Co. board met with FBI officials about Harvey Weinstein earlier this month, a third board member has said she also met with agents. Lauren Sivan, the former Netflix executive who was the first board member to speak publicly about the board's investigation into Weinstein, told TheWrap she met with an FBI agent in October. "I know because it was on my schedule," she said when asked if she had met with an agent. In a recent interview with The Hollywood Reporter, Sivan told THR that she "was told it was due to the Weinstein Co. situation." The board's investigators, which include an attorney, have reportedly been going through emails, spreadsheets and financial documents and interviewing current and former board members. Sivan, who co-founded the streaming service with Netflix CEO Reed Hastings in 2012, told THR that she met with the FBI agent in October for a few hours in the office at the company's Hollywood headquarters. She said she had no specific reason to believe that there was a "scam" on the board. "I have no

We studied the peculiarities of molecular epidemiology of chronic viral hepatitis B in a Tatar population residing in Bashkortostan. Based on the results of analysis of HBV sequences in chronic carriers, it was found that there were multiple strains of HBV circulating in Tatar population, as well as the situation when two strains coexisted in one patient. Moreover, the variants with high nucleotide homology of two strains were revealed. The frequency of the mutants occurring in the Tatars was lower than in Caucasians ($4.2 \pm 0.1 \times 10^{-4}$) and $8.9 \pm 0.4 \times 10^{-4}$, respectively). This is presumably due to a specific nature of the Tatar population and its survival in a hostile environment of Kazakhstan.The present invention relates to a semiconductor integrated circuit device having a soft error resistant structure and a method for fabricating the same, and particularly to a semiconductor integrated circuit device having a well structure having a stacked structure of a first conductivity type (P-type or N-type) semiconductor layer and a second conductivity type (N-type or P-type) semiconductor layer, and a method for fabricating the same. In the process for manufacturing a semiconductor integrated circuit, the formation of a P-type semiconductor well region is needed for obtaining a high breakdown voltage of a P-channel MOS transistor or a high breakdown voltage of an N-channel MOS transistor. A semiconductor well region is a region formed on a surface of a semiconductor substrate in the semiconductor integrated circuit. The semiconductor well region contains a P-type well region or an N-type well region. The former is used for a P-channel MOS transistor, and the latter is used for an N-channel MOS transistor. In the fabrication of the semiconductor integrated circuit, a P-type semiconductor well region is generally formed by a first ion implantation process with a P-type impurity material for forming the P-type well region. A P-type semiconductor well region having a high impurity concentration is formed in a region where a P-channel MOS transistor is formed. After forming a P-type semiconductor well region, an N-type semiconductor layer is formed by a second ion implantation process with an N-type impurity material for forming the N
