Involvement of DNA topoisomerase II in the cytotoxicity of 2-aminothiazole derivatives. 2-Aminothiazole (2-AT) is a member of the 2-aminothiazole-derived agents (TADAs) with DNA cleavage-inducing activity against cancer cells. Although these compounds have been shown to be cytotoxic agents, the mechanism of action of TADAs has not been clarified. We hypothesized that 2-AT may induce DNA damage by a mechanism similar to that of a topoisomerase II inhibitor. In the present study, two different 2-AT derivatives, 2-amino-4-methylthiazole (2-AMT) and 2-aminobenzimidazole (2-AB), were used as probes to clarify the relationship between the induction of DNA damage and the cytotoxicity of 2-AT. 2-AMT and 2-AB were more toxic to HT-29 cells than 2-AT, while they exerted little toxicity on wild-type CHO cells. Both compounds induced DNA double-strand breaks in HT-29 cells as determined by comet assays. These results suggest that the cytotoxicity of 2-AMT and 2-AB is due to their ability to generate DNA damage, specifically double-strand breaks, through their topoisomerase II-like activity.

Q: Solve the system $\frac{dV}{dt} = \gamma V + \sqrt{6} A \cos \Omega t$, $\frac{dA}{dt} = 0$ Consider the complex vector field $\mathcal{F} = \gamma \frac{dV}{dt} + \sqrt{6} i A \cos \Omega t \mathbf{e}_x$
