Taylor is a Californian businessman, who is the founder, CEO and chairman of the board of RTA International, Inc., a private American company. Taylor founded RTA International in 1979 to develop and produce "rocket-propelled, air-launched missiles", which were used by the United States Department of Defense for reconnaissance purposes. Early life and education Taylor was born in El Monte, California in 1946. He has two children, Donald Taylor and Frances Taylor Martin. Taylor had his first job when he was nine years old, working in a grocery store. In 1965, Taylor graduated from the University of California, Berkeley and obtained his degree in Electrical Engineering. Taylor became a member of the Delta Xi chapter of the Tau Kappa Epsilon Fraternity. From 1976 to 1979, Taylor worked on a PhD in Electrical Engineering at the University of California, Los Angeles. Career Taylor's first job in industry was as a Product Manager at McDonnell Douglas Corporation in California. Taylor moved to Trident Corporation where he was the Director of Engineering of the Systems Division. There, he worked on the VAMP (Vertical Assembly and Machining Program) project. There, Taylor conceived the idea of rocket propelled projectiles and thought of using the British Q training rocket as the basis of it. His concept was rejected by Trident but then Taylor worked on a new project at RTA Corporation, which was now in business as Rocket Technology, Inc. The Q rocket was used for the prototype launch vehicle. Taylor founded Rocket Technology, Inc. on April 1, 1979 with an initial capital contribution of \$35,000, and a contract to produce the first ground test vehicle. Rocket Technology, Inc. started the production of a new rocket propulsion system, the Rocket Launched Ground Vehicle, on July 11, 1979. Taylor projected that the company would create a full-scale rocket by 1987. On April 7, 1985, Taylor also founded Blackbird Technologies, Inc., a company that would develop the Blackbird satellite. On February 16, 1986,

A new study from the University of Oklahoma, published this month in the Proceedings of the National Academy of Sciences, suggests that animals living in urban spaces can become better adapted to polluted environments than those living in more pristine areas. "This is the first evidence that actually suggests that the wild animals are able to act on the environment where they live, instead of just being passive victims of whatever sort of the environment is given to them," said Alex Alves, assistant professor of biology in the University of Oklahoma College of Science and Mathematics and a co-author of the study. The study is being presented this week at the annual meeting of the Society for Integrative and Comparative Biology in Oaxaca, Mexico. The research was conducted in the City of Mexicali in Baja California in southeastern Mexico, in cooperation with the University of California at Berkeley and the National Autonomous University of Mexico in Mexico City. While different species of animals may react to different pollutants, the research focuses on cacti, the more common type of desert plant that grows in the middle of cities as well as rural areas, and is one of the major sources of drinking water in Baja California. Cacti have a specific method of reacting to pollutants in their environments. They take in the toxins, which are stored inside leaves of the plant, in the form of glycolic acid. Then, once the toxins enter the root of the plant, they are transported back into the plant's cells, where they can be used by the plant to perform photosynthesis. The process helps the plant grow and to produce energy, making it an important food source for many desert animals. A research team led by University of Oklahoma Professor of Biology David L. Arnold, who is also a staff research associate at the Smithsonian Tropical Research

Institute in Panama, collected plants in six different areas: an area in Mexico City that has higher levels of ozone pollution from traffic, a rural area, a polluted urban area, a rural area in San Diego that has particulate matter from air pollution in the atmosphere, and a rural area in Mexico without pollutants. "The plants we collected came from at least three different environments within
